

Three-flowered Melic-grass

Melica nitens

Description

Three-flowered melic-grass is a perennial grass that grows from 1½ to 4 feet (5-12 dm) in height. The leaves are alternately arranged, linear, flattened, elongate, 4 to 8 inches (10-20 cm) in length and about 3/8 inch (5-12 mm) in width. The flowers, appearing from late May into July, are grouped in spikelets that are scattered in a branched terminal cluster. The individual spikelets are 3/8 to ½ inch (9-12 mm) in length, contain usually 3 flowers, and tend to hang downward when mature.

Distribution & Habitat

Three-flowered melic-grass has a distribution from southern Pennsylvania south and west into Florida and Texas. In Pennsylvania, this species reaches a northern border of its known range and has been documented historically in a few southern counties. It grows on cliffs, rock outcrops, rocky slopes and shores, and dry woods.

North American State/Province Conservation Status

Current State Status

The PA Biological Survey (PABS) considers three-flowered melic-grass to be a species of special concern, based on the few occurrences that have been recently confirmed. It has a PA legal rarity status and a PABS suggested rarity status of Threatened. About 5 populations are currently known from the state.

Conservation Considerations

The known populations of three-flowered melic-grass have threats from natural succession, invasive species, and the indiscriminate application of herbicide. Because of the preference of the species for relatively open habitats, active management, such as fire, mowing, or invasive species removal, may be required to maintain the proper successional stage and ecological conditions for the species to thrive.

NatureServe conservation status ranks

G5 – Secure globally; S2 – Imperiled in Pennsylvania
